
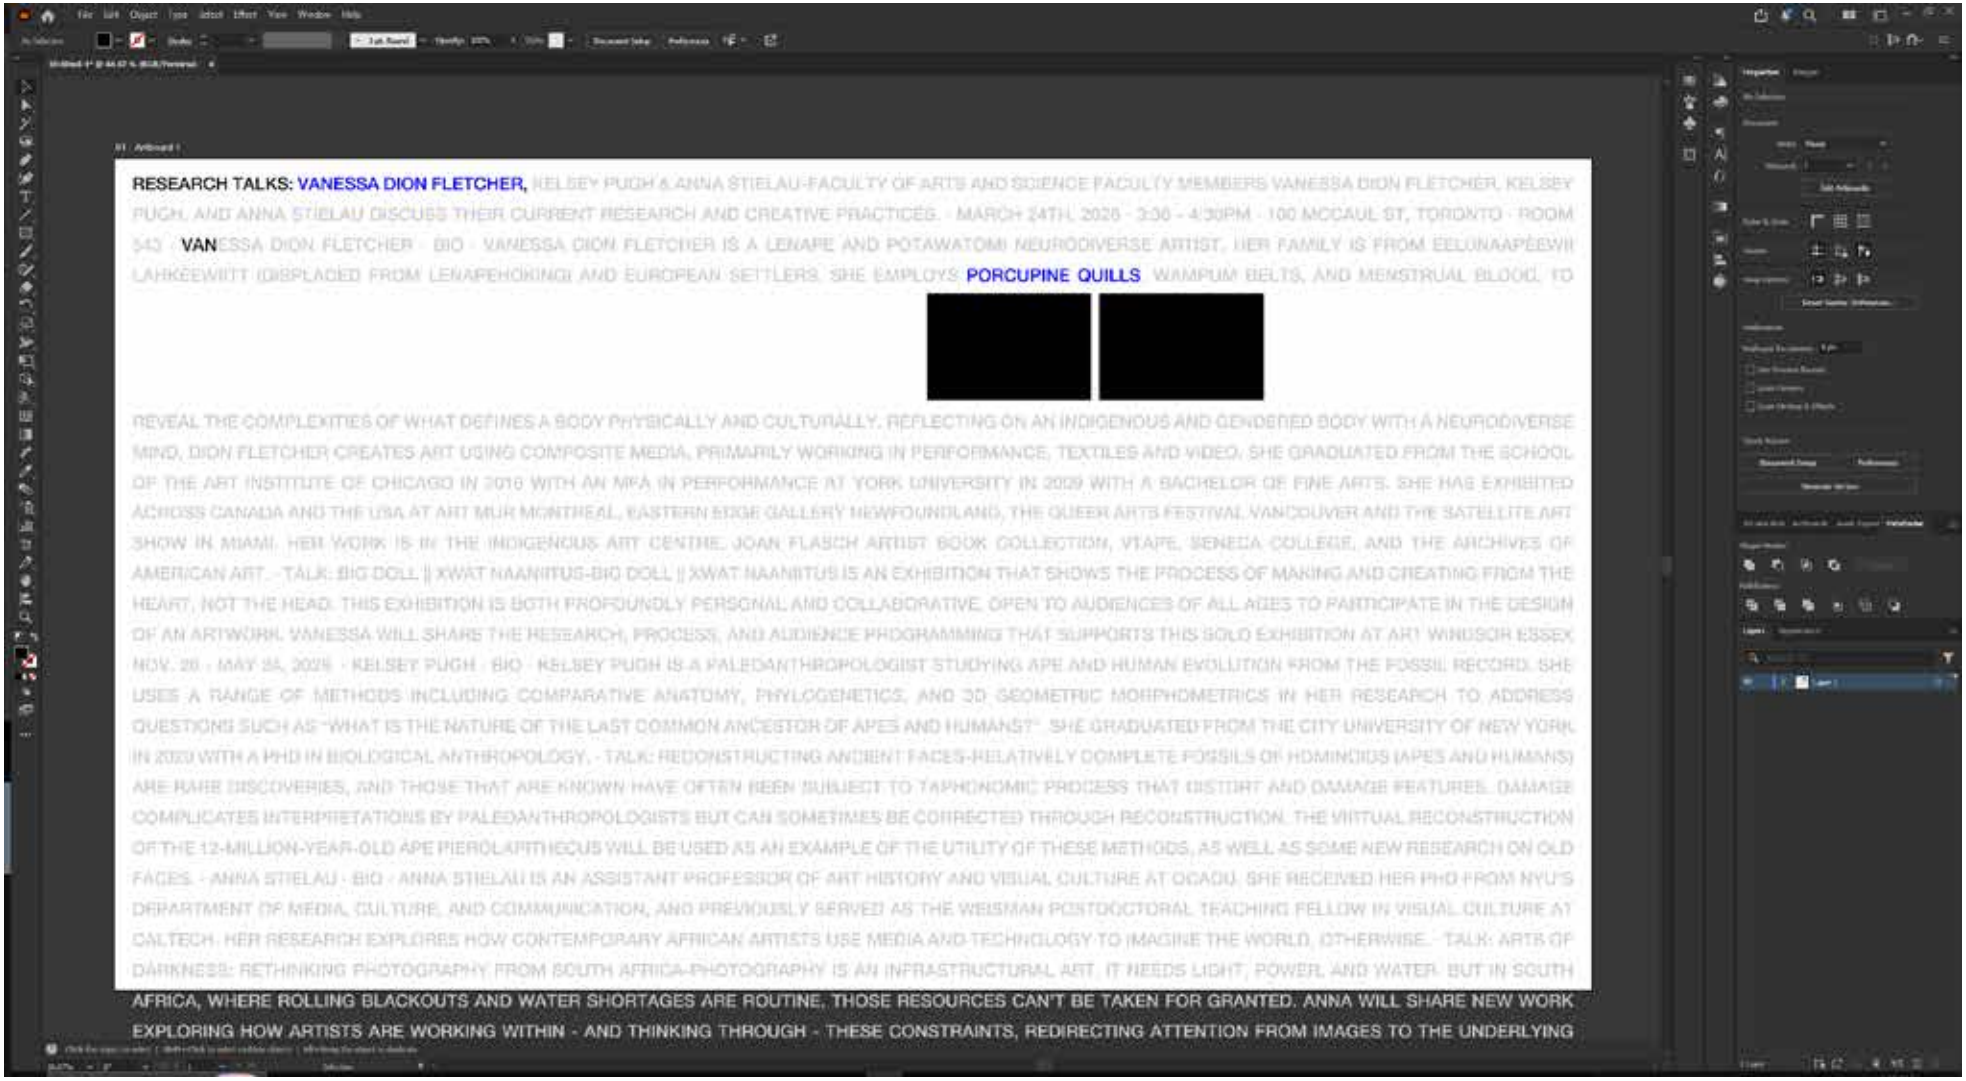
I wanted to create something that really drove home the idea of type. I started by laying out all the text in an Illustrator file and brainstorming ways I could make this poster. I thought about:

- text moving when typed, creating space for more text
- manually typing out the text
- typing to search through the page

I settled on manually typing out the text in a style like monkeytype.com.
I thought it was interesting how typing out the text creates a new form of interaction

Furthermore, the act of "researching" involves finding new information from what's presented, and I wanted to add this effect within the page.



laid out text, and showed the primary interaction mechanic being clickable links that reveal when portions of the text are fully typed out

text would expand to include the images

early prototype as I was learning, added a background while working on it but I really didn't like it
started with the "typing test" mechanic (typing catcher box at the bottom), and putting the text onto the page

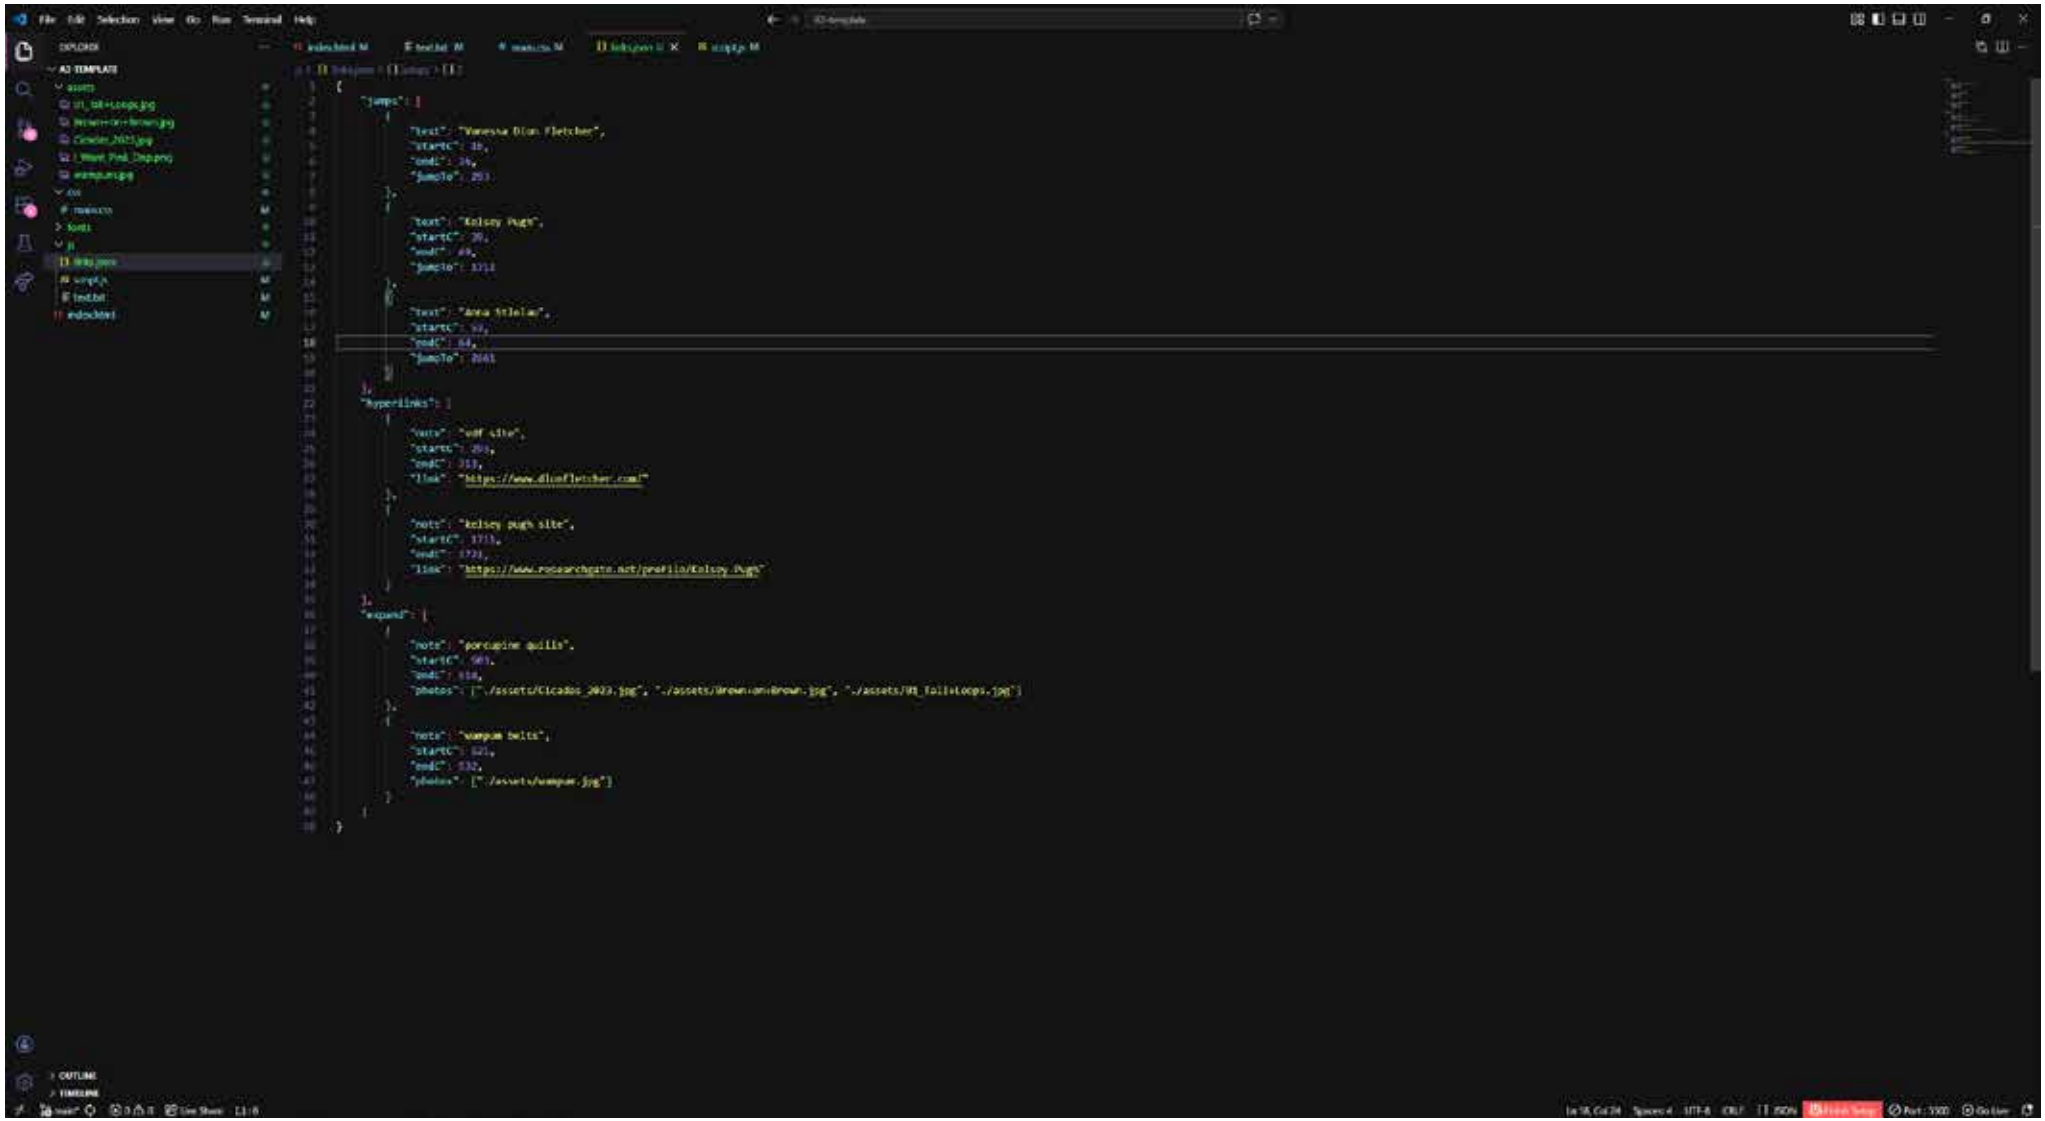
adding expandable parts and clickable links



structure of the links, was the most time consuming part sourcing images and assigning each individual link start/end
